

Integration of Mobility Data with Weather Information

*Nikolaos Koutroumanis, Georgios M. Santipantakis, Apostolos Glenis, **Christos Doulkeridis** and George A. Vouros*

***Department of Digital Systems
School of Information and Communication Technologies
University of Piraeus, Greece***

This work is funded by the European Union's Horizon 2020 research and innovation programme under grant agreement No 687591 (datAcron), No 780754 (Track&Know), No 779747 (BigDataStack) and No 777695 (MASTER)

Motivation

- In several applications, **surveillance data from moving objects** are collected at **ever-increasing rates**
 - Fleet management applications
 - Maritime monitoring systems
 - Aircraft surveillance systems and radars
- Challenge:
 - **Integrate** such dynamic data with weather data
- Why?
 - To facilitate analysis of mobility data in association with weather
 - To discover hidden patterns
 - To improve the understanding of mobility patterns

Applications

- Urban domain – fleet management

- More accurate **fuel estimation**

- Project Track&Know: <https://trackandknowproject.eu/>

- Maritime domain

- More accurate **trajectory prediction**

- Project BigDataStack: <https://bigdatastack.eu/>

- Air-traffic management domain

- Improved **forecasting** of **flight regulations** and **delays**

- Project dataAcron: <http://www.datacron-project.eu/>

- The design and implementation of a **weather integration system**, with several salient features:
 - it works as a **standalone** and **re-usable tool** for data integration of mobility data with weather,
 - it is **efficient** in terms of processing performance, thus making it suitable for application in online scenarios (stream processing)
 - it supports **enrichment of complex geometries** (e.g., polylines, polygons) with weather data, which is not straightforward

Available for download:

Weather data

- GRIB: a file format for storage and transport of gridded meteorological data
- The GRIB standard was designed to be self-describing, compact and portable
 - Maintained by the World Meteorological Organization
 - All National Met Services (NMS) use GRIB files to store and exchange **forecast** data
- Data is provided from Numerical Weather Prediction models (computer-generated)
 - Provided by NOAA (National Oceanic and Atmospheric Administration)

Source: <http://weather.mailasail.com/Franks-Weather/Grib-Files-Explained>

Weather data

- Internal file representation
 - Values are on a 3-D grid of points
 - Contains dozens of weather attributes (more than 100)
 - **Each GRIB file** contains weather data for a **timespan of 6 hours**
 - One day is composed of 4 GRIB files

*Spatio-temporal
position: (x,y,t)*

Weather data

Access to weather data

Architecture (high-level)

Architecture

1. Spatio-temporal parser

Spatio-Temporal Parser

Trajectory point

Diagram illustrating the Dataset with Spatio-Temporal Information, showing a stack of tables representing multiple trajectory points. The tables contain columns: objectId, lon, lat, date, and ... (ellipsis). The example rows show data for objectId 465 and 624, with coordinates and timestamps.

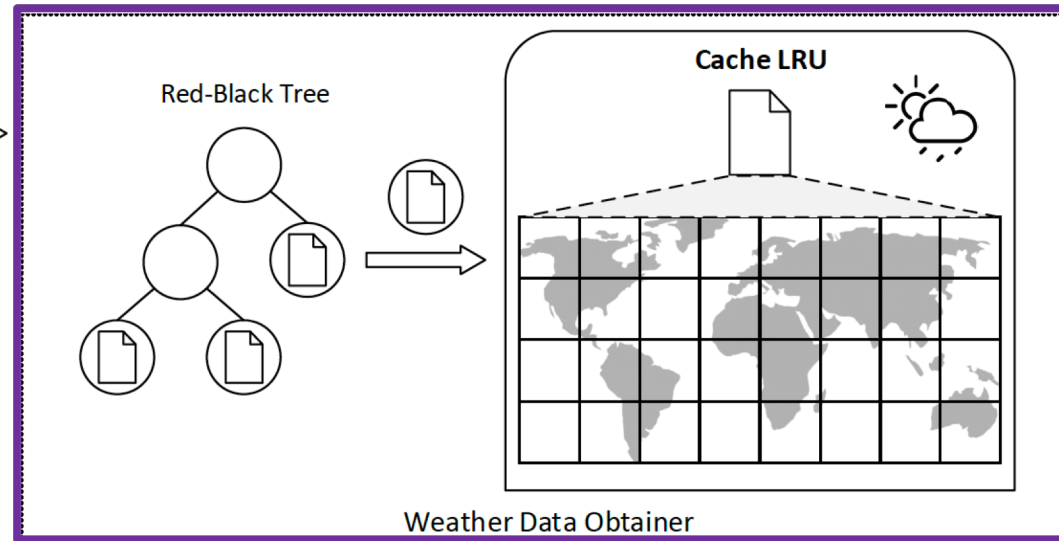

objectId	lon	lat	date	...
465			2017/04/30	...
465			2017/05/01	...
624			2017/05/01	...
624	862_41	23.79	2017/05/01 10:45:19	...
624	862_41	23.78	2017/05/01 10:50:24	...
624	862_41	23.78	2017/05/01 10:53:06	...
624	862_41	23.79	2017/05/01 10:59:10	...

Dataset of Grib Files

Trajectory point with
weather attr. (w_1, \dots, w_n)

String Concatenation

Diagram illustrating the String Concatenation step, showing a table structure with columns: objectId, lon, lat, date, ... (ellipsis), w_1 , ... (ellipsis), w_n . The example row contains: 465_18, 22.61, 40.56, 2017/04/30 19:03:06, ..., 0.05, ..., 19.

objectId	lon	lat	date	...	w_1	...	w_n
465_18	22.61	40.56	2017/04/30 19:03:06	...	0.05	...	19

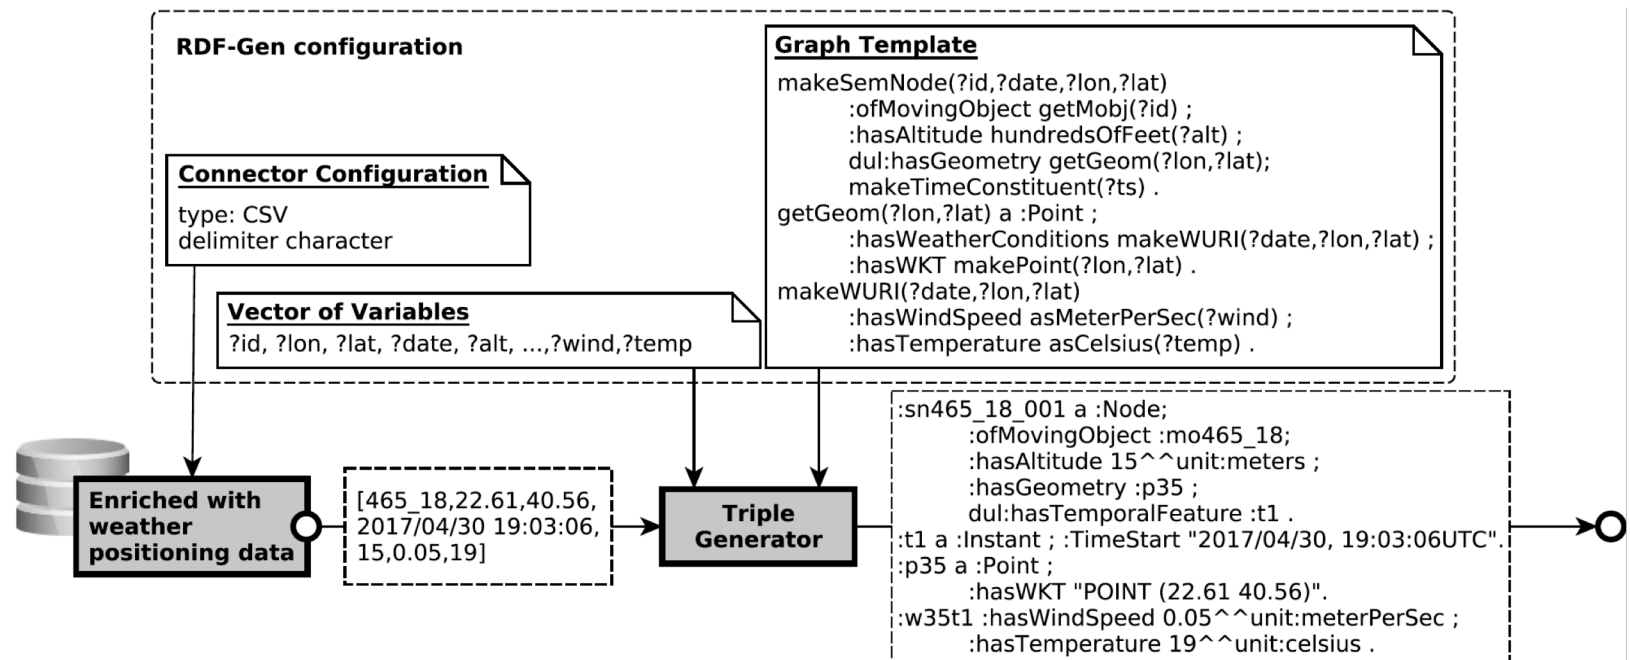

Store

Enriched Files with Weather Data

- Aim: avoid the cost of re-opening GRIB files to access data
- This is necessary for applications where positions of moving objects are not temporally sorted
- Maintain a **cache** of references to open files
 - Cache size: user-specified
 - Cache replacement policy: LRU
- Reduces the overhead of repeated open/close operations

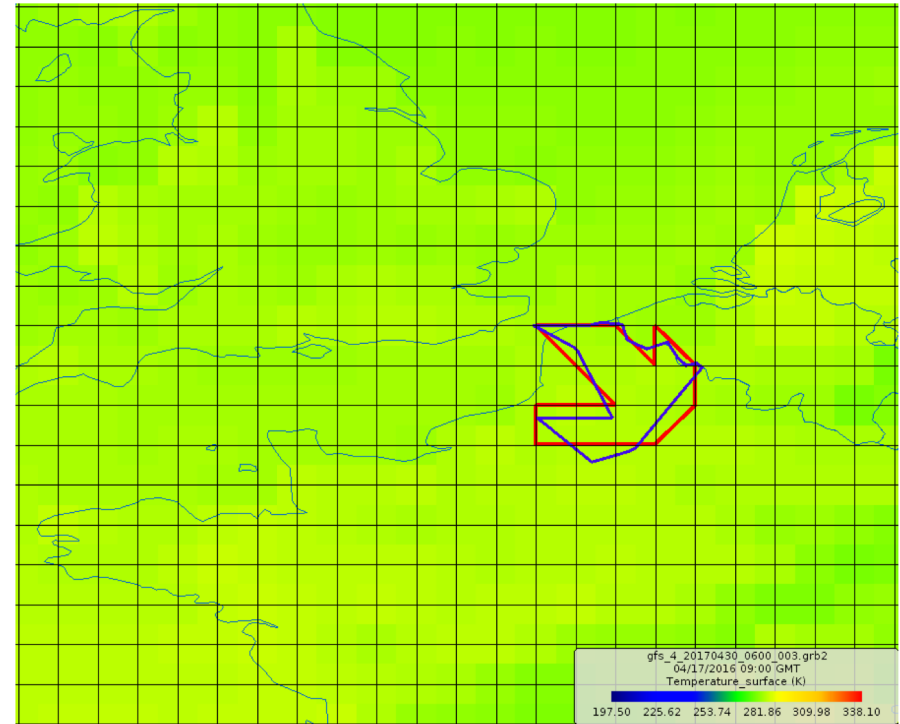

Extension #1 – Linked data

- Ability to output data in RDF format, as Linked Data
- By exploiting the RDF-Gen tool (also developed by our group)

Extension #2 – Complex geometries

- Beyond points
- Supporting complex geometries
 - Trajectory (polyline)
 - 3D Airblock/Sector (polygon)
- Complex geometries may span multiple cells
- Retrieve weather attribute values for points of simplified geometry
- Different kinds of aggregations are then possible (e.g., mean, median, max/min, etc.)

2D projection of an airblock (blue)
and simplified geometry (red)

Experiments – Data sets

- **Mobility traces** (from industrial data provider – fleet management)
 - 25 attributes, CSV format
 - Spatial coverage: Greece
 - **Small**: 4.5K records, 5.1MB
 - Temporal coverage: Jan.2018
 - **Large**: 81.5M records, 10GB
 - Temporal coverage: Jul.2017-Jun.2018
- **Weather data**
 - Binary files: 124 (31*4) files, ~8GB
 - Spatial coverage: the entire world
 - Temporal coverage: Jan.2018

Experimental evaluation

- **Experimental Setup:**

- Task:

- Enrich **positions of moving objects** with **13 rain-related weather attributes**

- Platform:

- 3.6GHZ i7-4790 processor, 16GB DDR3 1600MHz RAM, 1TB HDD

- Metrics:

- Execution time
 - Throughput
 - Cache hit ratio

Performance results

Table 1: Evaluation on small data set.

Weather Integration	Execution Time	Memory Consumption	Throughput
With Indexing	12 sec	229 MB	3,570 rows/sec
Without Indexing	1,660 sec	106 MB	26 rows/sec
Pre-processing	1 sec	57 MB	N/A

Table 2: Evaluation on large data set.

Procedure	Execution Time	Memory Consumption	Throughput
Weather Integration	29,261 sec	176 MB	2,784 rows/sec
Pre-Processing	5 sec	59 MB	N/A

Evaluation of caching mechanism

- Randomly shuffle the input records of mobility traces
- Thus, generating a mobility data set in random temporal order
- Worst-case scenario:
 - Low probability that two consequent records will use the same GRIB file

Figure 5: Cache hit ratio for increased cache size.

Figure 7: Throughput for increased cache size.

Conclusions & outlook

- We presented a **system** for **enrichment** of **mobility data** with **weather**
- On a conventional machine on temporally sorted mobility data
 - Achieved throughput: **~3.5K rows/sec**
- Also supporting **complex geometries** and **output of linked data**
- Available for download: <https://github.com/nkoutroumanis/Weather-Integrator>
- In the future, we plan to extend our system:
 - Parallelize processing for improved performance
 - Improve the accuracy of weather enrichment of complex geometries

Thank you for your attention
